

EXECUTIVE THERMAL AUDIT

Prepared for: Test Client

MONTHLY FINANCIAL WASTE

\$500.00

Due to thermal throttling and clock downclocking events.

GPU Telemetry & Thermal Throttling Analysis

Analysis:

The data indicates that 5 out of 10 GPUs have exceeded the thermal threshold, causing the hardware to automatically downclock to prevent permanent damage. This reduction in clock speed directly translates to lost compute cycles and increased training/inference time.

CapEx & Hardware Inefficiency Assessment

Thermal throttling doesn't just cost time; it creates 'Ghost Hardware'.

Equivalent Idle Capacity: 1.00 GPUs

This means you are paying for the power, cooling, and rack space of hardware that is operating significantly below its rated capacity.

ThermaCompute Dual-Brain Architecture

System 1: The Reflex

Real-time telemetry monitoring.
Instant throttling detection.

System 2: The Predictive

Pattern recognition over time.
Proactive thermal load shifting.

Action Plan

1. Immediate thermal audit of all H100/A100 clusters.

Get a head start on the Thermal Compute Rollout

Join Batch 1 Implementation

Secure your seat for the initial rollout.
